Adatkezelés XML-ben
2. féléves beadandó feladat
JAXB programozás

Név: Kiss Áron
Neptun kód: UHV61T
Gyakorlatvezető: Agárdi Anita
Gyakorlat: Szerda 10-12

A feladat rövid leírása

A feladat a korábban megírt XML sémát használó Java program írása, amely egy példa XML adatbázison hajt végre író, lekérdező, módosító, és törlő műveleteket.

A feladat megoldására JAXB programot írtam.

Példa XML adatbázis

A program a következő XML adatbázison hajtja végre a megfelelő műveleteket. Az adatbázis a korábban bemutatott XMLSchema-ra épül:

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>

JAXB program

A program parancssori menürendszerrel működik, a következő műveletek végrehajtására képes:

- Új könyv hozzáadása
- Könyv lekérdezése ISBN alapján
- Könyvek lekérdezése az író neve alapján
- Könyv módosítása
- Könyv törlése

A program a sémából XJC-vel generált osztályok mellett 2 további osztályt tartalmaz:

- Runnable: A program belépési pontja, amely biztosítja a felhasználó számára a menürendszert, és továbbítja a kéréseit a Controller osztálynak.
- Controller: Ez az osztály kezeli az XML adatbázist, JAXB segítségével. Elérhető metódusai a következők:

    o **void** createBook (BookType bookToAdd)
      Az átadott BookType objektumban szereplő adatokkal új könyvet hoz létre az adatbázisban.

    o BookType readBook (**long** isbn)
      Visszaadja az adott ISBN-nel rendelkező könyvet az adatbázisból.

    o ArrayList<BookType> readBooksByAuthor (String authorToSearch)
      Visszaadja az adott író könyveit az adatbázisból.

- o **void** updateBook (BookType bookToUpdate)

  Módosítja a megfelelő könyvet az adatbázisban (ISBN alapján).

- o **void** deleteBook (String isbnToSearch)

  Törli a megfelelő ISBN-nel rendelkező könyvet az adatbázisból.
